# MPLS Explained

**AdaptiveComms**  
Successful in Communication

Modern Business Networks have to cope with multiple applications and functions such as email, web browsing, file transfer, video streaming and VoIP, all of these are vying for the same bandwidth. If your network is clogged up with emails and web browsing, unless you have expensive managed routers at all your sites to control the Quality of Service (QoS) (and the IT Personnel to run them), you may not be able to make a vital VoIP call or transfer a time critical file off a remote server.

Our MPLS IP-VPN Networks are a way of connecting multiple sites together with various types of data connectivity, be that 8mb Broadband or 100mb Ethernet. You can do this whilst controlling the priority of Business critical applications like VoIP and time critical data transfer, without the need for expensive managed routers.

Our solution is ideal for any Business with between 2 and 1000's of locations. You only pay once to create your network, you can then deploy as many MPLS Connections as you wish rapidly and simply by adding DSL connection or Ethernet, no additional configuration is needed, the only additional cost is that of the connectivity.

## Benefits of MPLS:

- **Secure** - Allowing you to transfer critical data between sites without having to worry about you information getting into the wrong hands.
- **Fast** - Giving you the ability to stay productive a stay ahead of the competition.
- **Reliable** - Always connected technologies with 4-6 hour fix time SLA's give you the confidence to put your business critical network in our hands.
- **Scalable** - Easily increase your bandwidth to match your requirements.
- **Flexible** - Add additional sites to your network quickly with any type of DSL connection, then upgrade to Ethernet if you wish.
- **Prioritize** - Connect remote sites phone systems together and video conference knowing that voice and video have priority over other data types.
- **Reduced Costs** – Greatly save on call costs and reduce infrastructure costs by running both voice and data over a single network.

## Why choose AdaptiveComms for your MPLS network?

AdaptiveComms can design, provide and install bespoke MPLS Network solutions that greatly enhance you're businesses efficiency and productivity. We provide long term ongoing support to your business and fantastic customer service including a named contact in our UK based offices.

We regularly host seminars on topics including MPLS Networks, to give you a better understanding on what it is and how it can improve your business. Contact a member of our team today to find out when our next seminar on MPLS is taking place.
